

## Histogram of Golden Crowned Kinglet

This histogram demonstrates how many sites observed 0, 1, 2, 3, or 4 birds (the birds in this case being golden crowned kinglets). There are a very large number of sites (greater than 400) that did not record any sightings of golden crowned kinglets, and a very small number of sites that recorded 4 sightings of birds. Zero sites recorded 5 or more sightings of golden crowned kinglets.

There is a positive, linear relationship between `ba.con` and `ba.tot`. When `snag.dc1` is compared to `ba.con`, it seems to be concentrated around 40, and there are points that span as far out as 120.
